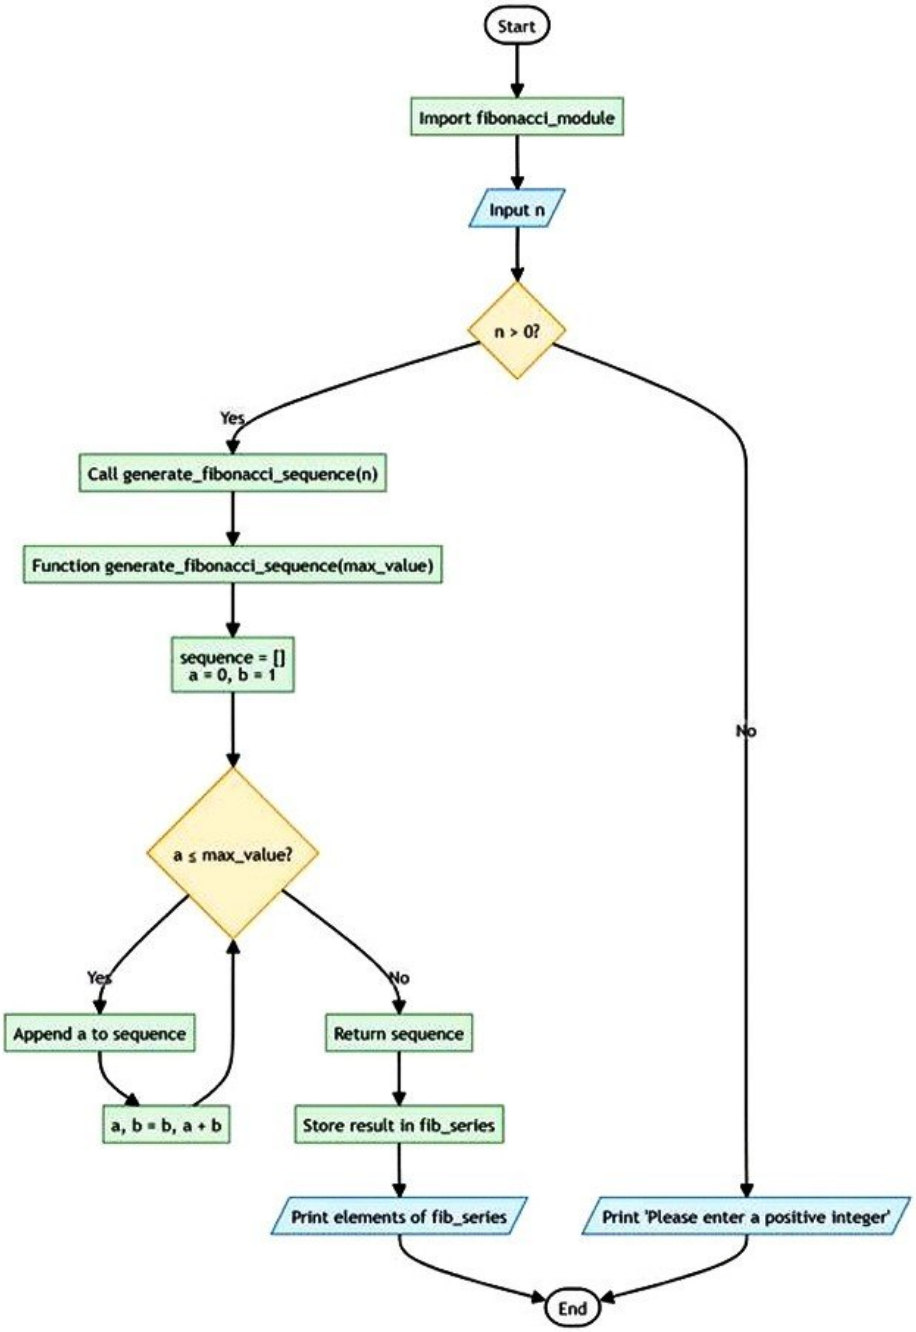
EXPERIMENT 13.1.1



Algorithm

1.Start

2. Define a function generate_fibonacci_sequence(max_value)

3.Initialize an empty list fib_sequence

4.Initialize first two Fibonacci numbers:

- a = 0
- b = 1

5.While a <= max_value, repeat:

- Add a to fib_sequence
- Compute next term:
- ○ next = a + b ○ Update a = b
- ○ Update b = next 6. Return fib_sequence

7. stop

Code:

```
import fibonacci_module

n = int(input())

if n > 0:

fib_series = fibonacci_module.generate_fibonacci_sequence(n)

print(' '.join(map(str, fib_series)))

else:

print("Please enter a positive integer")
```

13.1.1. Fibonacci Sequence using Modules

23:08

Write a Python program using modular programming to generate the Fibonacci sequence up to a given maximum value.

Module Requirements

- Create a module **fibonacci_module.py** with a function **generate_fibonacci_sequence(max_value)** that returns list of all Fibonacci numbers less than or equal to the maximum value.

Main Program Requirements

Create **main.py** that performs the following:

- Import the **fibonacci_module.**
- Read an integer n from user input.
- Validate if n is positive.
- If valid, call the module function and display the Fibonacci sequence.
- If invalid, display an error message.

Input Format:

- Single integer n representing the maximum value for Fibonacci sequence.

Output Format:

- If $n > 0$, print the Fibonacci sequence as space-separated numbers.
- If $n \leq 0$, print: "Please enter a positive integer".

Note:

- Two files are provided: **fibonacci_module.py** and **main.py**. The **main.py** file handles input and output. You need to complete both files based on the question requirements.

Sample Test Cases +

Explorer

main.py fibonacci_... SUBMIT

```python
# Write your code here.....

import fibonacci_module
n = int(input())

if n > 0:
    fib_series = fibonacci_module.generate_fibonacci_sequence(n)
    print(' '.join(map(str, fib_series)))
else:
    print("Please enter a positive integer")
```
